- APEX/Theme 25
- Beyond

Responsive Web Design

Responsive web design (RWD) covers various techniques, both client and server side, that aim to make a website respond to the device it is viewed on.

It means, writing one codebase that will adapt your website on every screen size, device and device orientation, in order to provide the best possible experience to the user.

Key Techniques of RWD

- CSS @Media queries
- Grid Layouts
- Device/browser detection to enhance performance of your site and reduce bloat

@media Queries

aren't limited to the device width condition: there are many different properties you can test against using @media queries, including the device orientation, height, aspect ratio and resolution

```
@media screen and (max-device-width: 640px) and (orientation:portrait) {  
    /* Rules inside the @media condition only apply if the condition is met */  
    #mydiv {  
        display: inline-block;  
    }  
}  
  
@media all and (orientation:portrait) { ... }  
@media all and (orientation:landscape) { ... }
```

@media Query Usage Inline

Put media queries directly in the style sheet.
This is the most common approach.

```
@media screen and (max-device-width: 640px) and (orientation:portrait) {  
    /* Rules inside the @media condition only apply if the condition is met */  
    #mydiv {  
        display: inline-block;  
    }  
}
```

@media Query Usage Import/Link

Use the @import rule to import style rules from other style sheets.

```
@import url(style600min.css) screen and (min-width: 600px);
```

Include a query in a linked style sheet's media attribute.

```
<link rel="stylesheet" type="text/css"  
      media="screen and (max-device-width: 800px)"  
      href="style800.css" />
```

@media query alternative

Use JavaScript to detect the viewport size and then set a className to the body element

```
1. //get crossbrowser window inner size
2. function get.innerWidth(){
3.   return (window.innerWidth)? window.innerWidth : ((document.documentElement
4.     .Element.clientWidth)? document.documentElement.clientWidth :
5.     document.body.clientWidth);
6. }
7. //check if window is big enough
8. if( get.innerWidth() >= 1440 ){
9.   document.body.className += ' wide'; //add the .wide class to the
10.  body element.
11. }
```

@media query & CSS Units

- Absolute
 - Pixels (px)
 - Point (pt) = 1/72 of an inch
- Relative units
 - are based on the initial value
 - em is relative to the initial value of 'font-size' (M)
 - Percentages (%)
- Resolution
 - dpi/dpcm: dots per 'inch'/'centimeter'

Adapt Layout with @media query

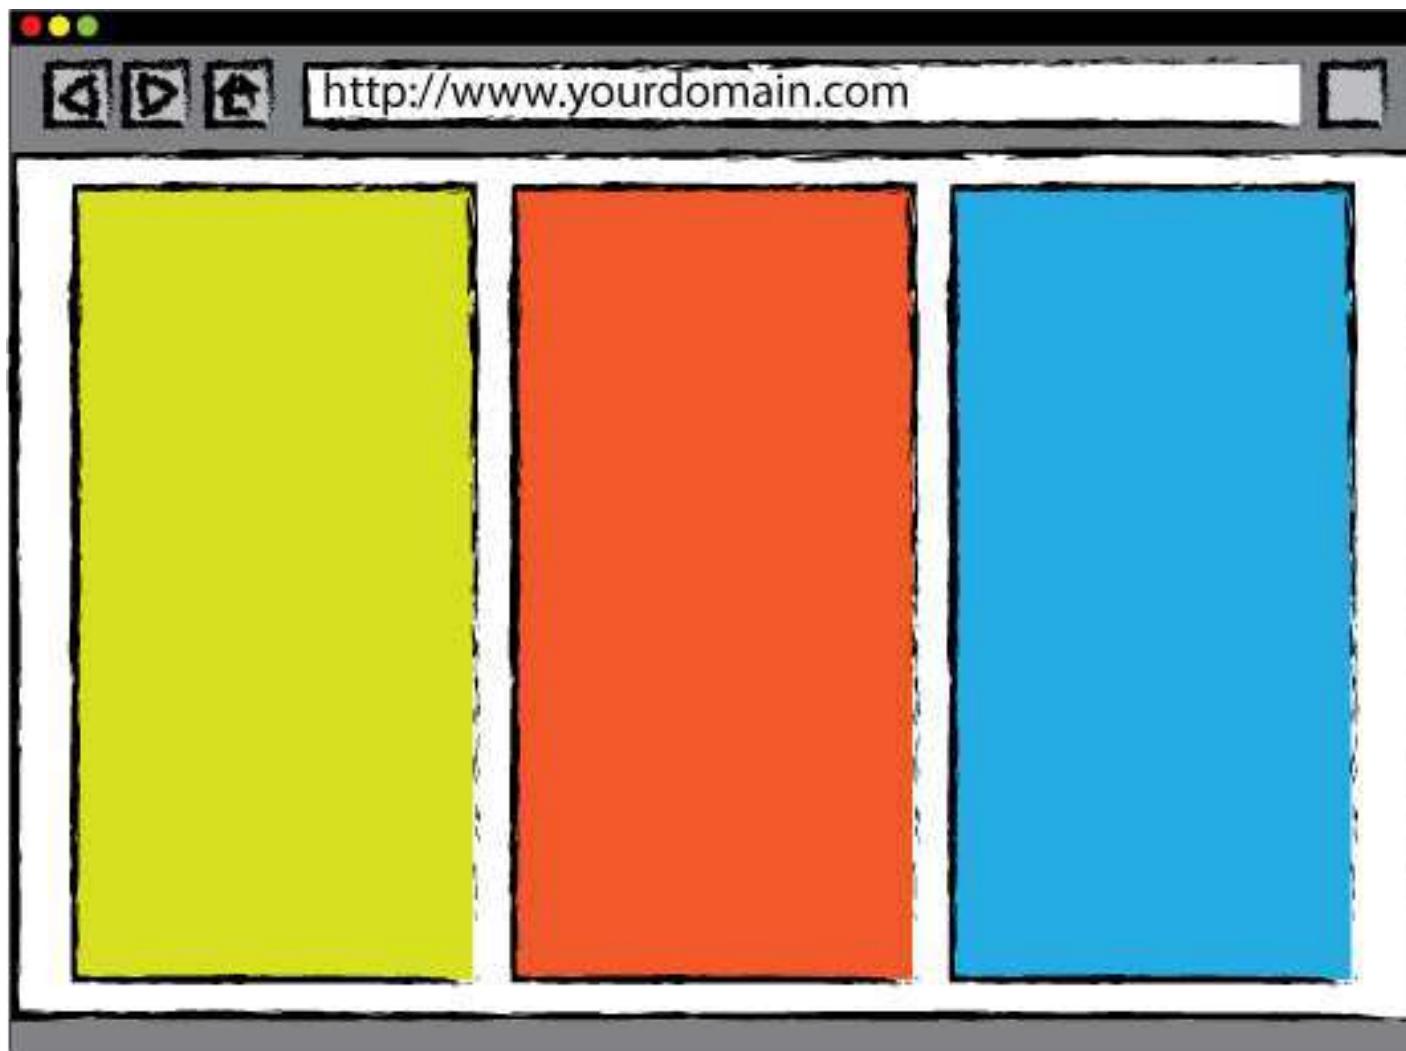

Desktop - 1600px

Netbook - 1024px

Tablet - 768px

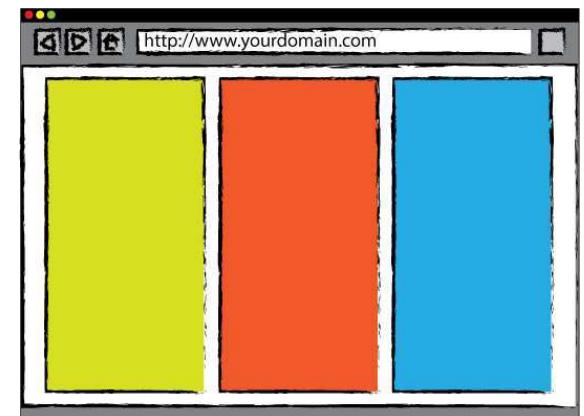

Smartphone - 320px

Three Column Desktop Layout

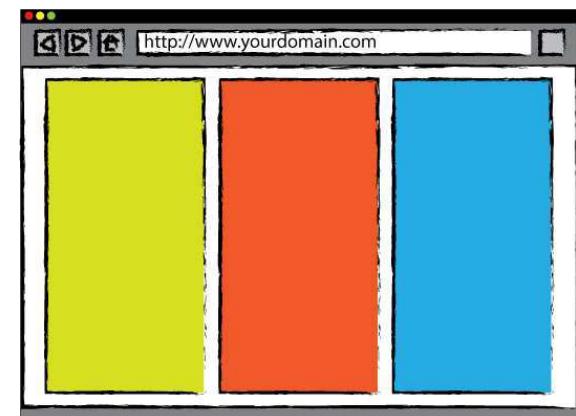

Example HTML

```
<div class="col1">  
    <p>...</p>  
</div>  
<div class="col2">  
    <p>...</p>  
</div>  
<div class="col3">  
    <p>...</p>  
</div>
```

Example CSS desktop

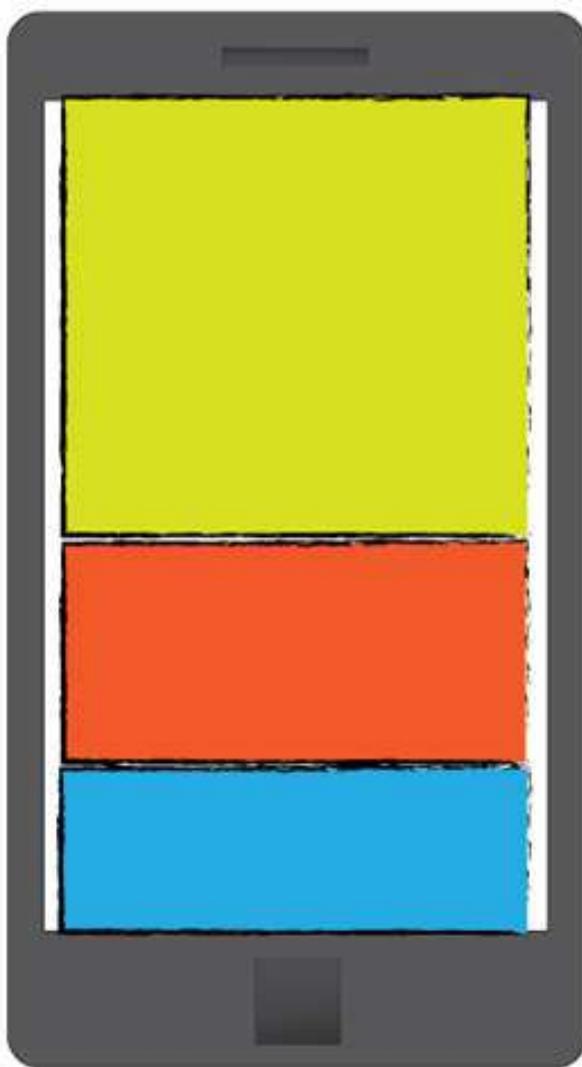

```
@media (min-device-width: 641px) {  
    /* target devices with desktop sized resolution */  
  
.col1, .col2, .col3 {  
    /* Float the columns to create a three-column layout */  
    padding:      2em;  
    width:        30%;  
    margin-right: 1em;  
    float:        left;  
}  
}
```

Example CSS smartphone

```
@media (max-device-width: 640px) {  
    /* target devices with small sized resolution */  
  
.col1, .col2, .col3 {  
    position:      relative;  
    padding:       2em;  
    width:         90%;  
    float:         none;  
    display:        block;  
    margin-right:  0;  
}  
  
}
```

Single Column Smartphone Layout

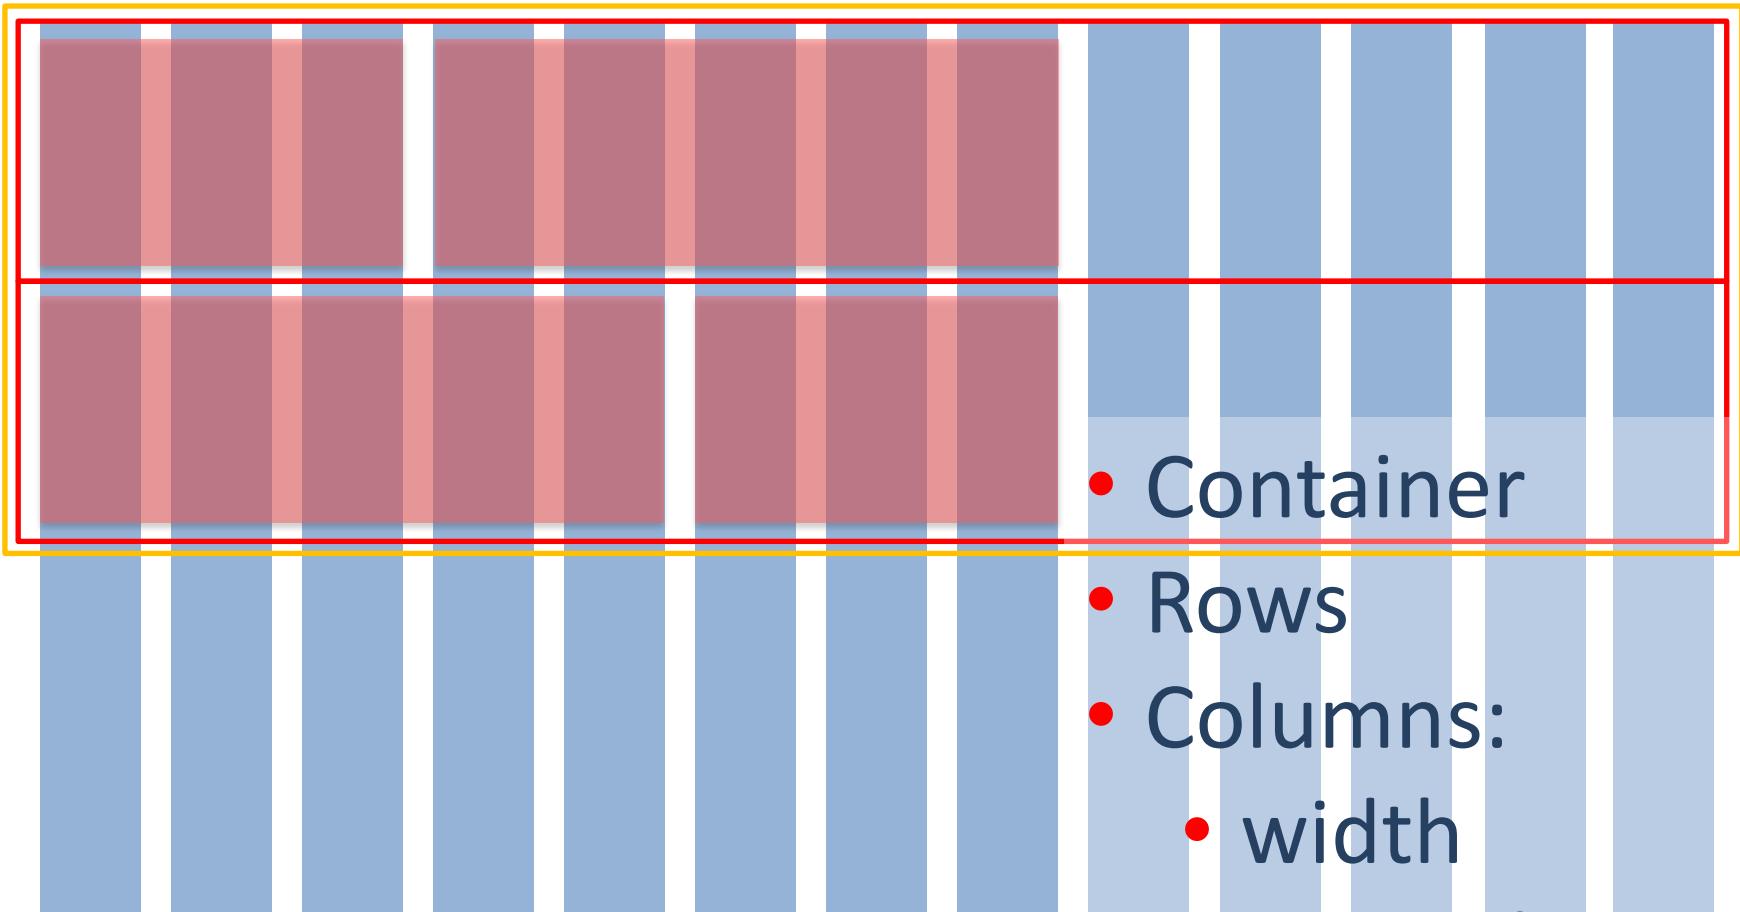

Floating

Grid What is it?

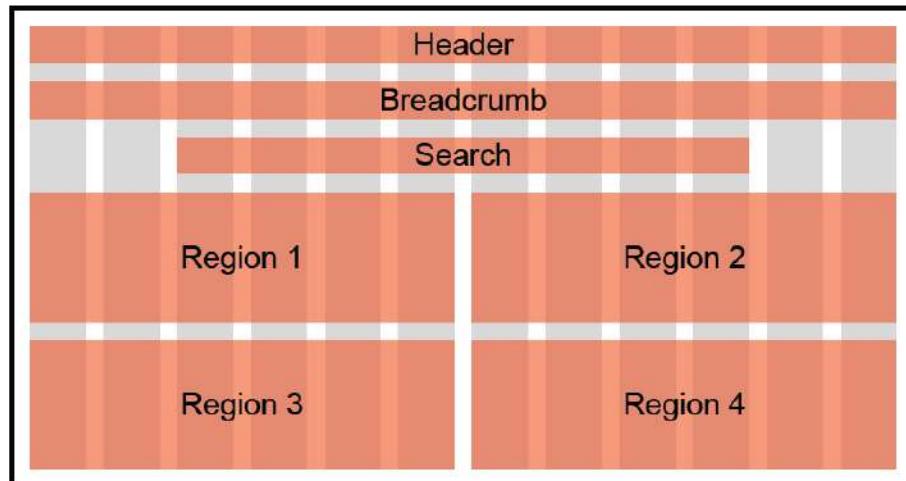

- Fixed Grid
 - Not necessarily responsive
 - Used to layout elements in a regular rhythm
- Fluid/Flexible Grid
- CSS3 Grid Layout

Grid Basics

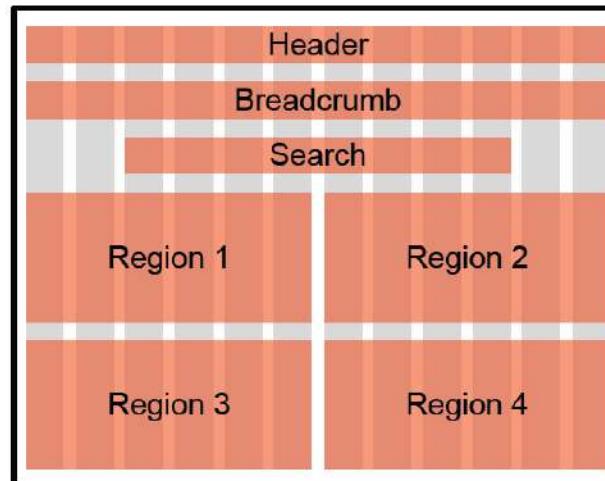

Responsive Grid

Desktop

Tablet

Mobile

CSS3 Grid Layout

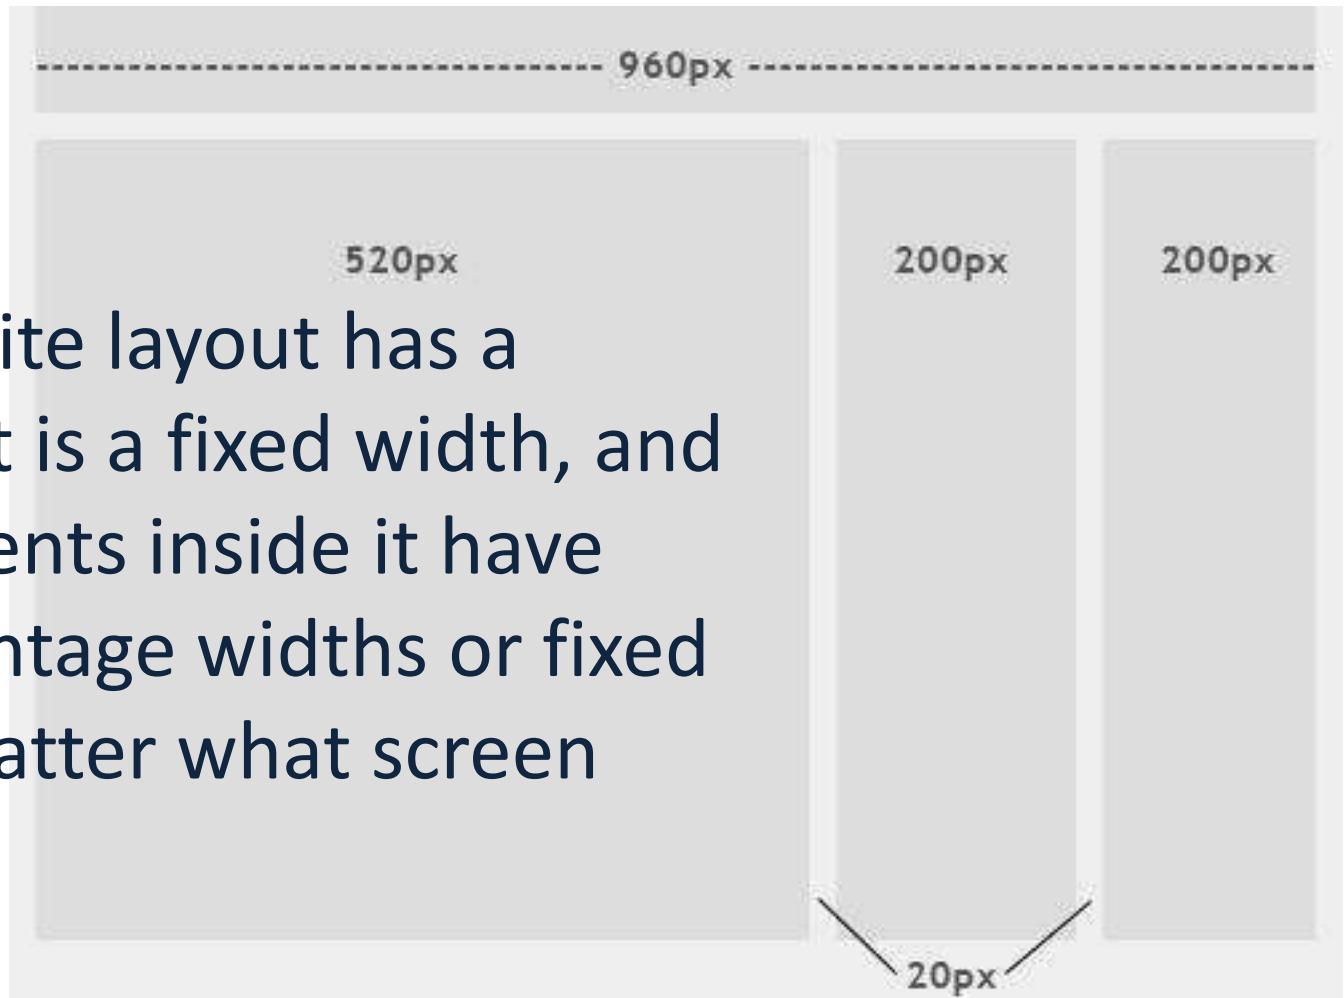

The image displays a 6x8 grid of numbered items (01 to 44) arranged in 6 rows and 8 columns. Item 41 is highlighted with a blue border. A tooltip window is open over item 41, showing the following CSS3 grid properties:

```
.grid41
  -ms-grid-column: 4;
  -ms-grid-column-span: 7;
  -ms-grid-row: 9;
  -ms-grid-row-span: 7;
```

<http://dev.w3.org/csswg/css-grid/>

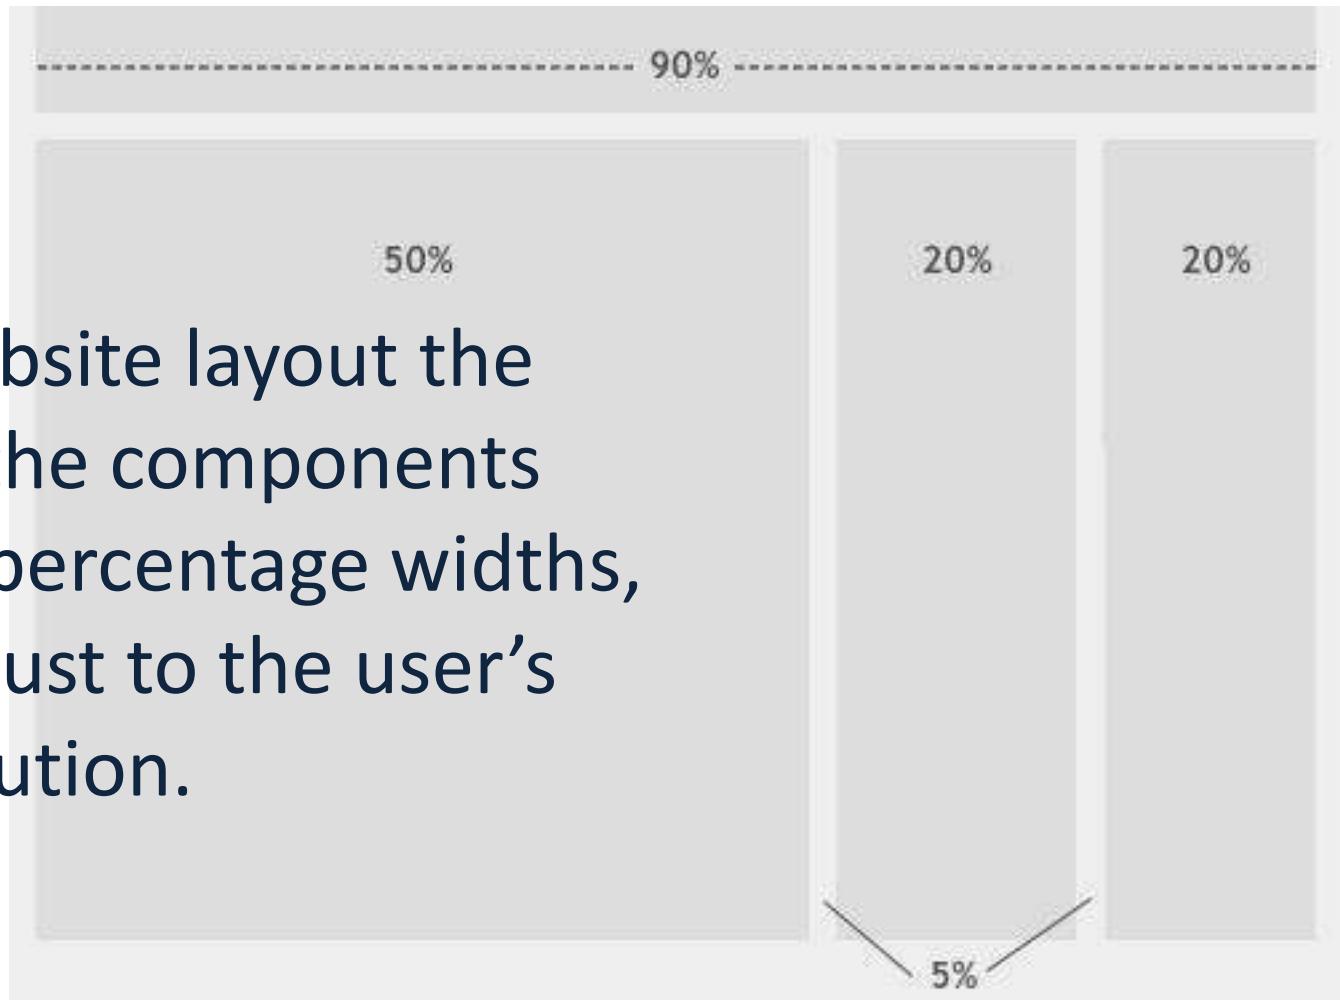

Fixed Website Layouts

A fixed website layout has a wrapper that is a fixed width, and the components inside it have either percentage widths or fixed widths no matter what screen resolution.

Fluid Website Layouts

In a fluid website layout the majority of the components inside have percentage widths, and thus adjust to the user's screen resolution.

Theme 25: Multiple Fixed Grids

@media screen	and min-width	320px	and max-width	479px
@media only screen	and min-width	480px	and max-width	767px
@media only screen	and max-width	767px		
@media only screen	and min-width	768px	and max-width	959px
@media only screen	and min-width	960px	and max-width	1024px
@media	screen and min-width	1260px	and max-width	1419px
@media	screen and min-width	1420px	and max-width	1659px
@media	screen and min-width	1660px	and max-width	1899px
@media	screen and min-width	1900px		
@media	screen and min-width	2540px		

APEX Responsive Features

- Declarative way to lay out regions and items on a page without manual css overrides (region attributes)
- Allows implementation of other grid frameworks such as twitterbootstrap, 960 gs, etc. (template)

Region Grid Layout Attributes

Field	Value	Description
Start New Row	Yes	Position the region in a new row.
	No	Position the region on the same row as the previous region. This is useful when positioning a region to aside another region.
Column	Automatic	Position the region in a specific grid column. Selecting Automatic will automatically use the next available grid column to display the region.
	1-12	Position the region at this specific grid column.
New Column	Yes	Position this region in the next column in the same row.
	No	Position this region in the same column as the previous region.
Column Span	Automatic	Determines how many grid columns should be used by the region. Selecting Automatic will balance the available grid columns within all regions in the same grid row.
	1-12	Use this specific number of grid columns for this region.

Theme 25 Grid

The screenshot shows a web browser window displaying an Oracle Application Express (APEX) application. The title bar reads "Home" and the URL is "localhost:8080/apex/f?p=108:1:13869969997979::NO:::". The page title is "RWD Demo". The top navigation bar includes links for "Home", "Page 2", "Page 3", and "End". On the right, there are user icons for "demo" and "Logout". A large blue "DEMO" watermark is overlaid on the page content.

The page content is organized into three regions:

- Navigation:** A sidebar containing "Sub 1". The bottom half of this sidebar has a red background.
- Region 2:** A wide central area labeled "Wide" at the top.
- Region 3:** A narrow vertical column on the right side.

At the bottom of the page, there is a link "Set Screen Reader Mode On" and the text "release 1.0". The footer contains navigation links: Home, Application 108, Edit Page 1, Create, Session, Caching, View Debug, Debug, Show Grid, and Show Edit Links.

RWD Considerations

- Developing a responsive application can be time consuming and may require a deep understanding of grid layout, HTML and CSS.
- Page size remains the same. You are loading the full HTML, CSS, and JS resources, even on mobile devices with limited broadband.
- Responsive Web Design is just the tip of the iceberg.

■ Theme 25 != Theme

DON'T PANIC

Beyond Theme 25

- Navigation
- Data Tables
- Leverage APEX condition feature with client property detection to optimize layout generation.
